ABSTRACT

This document presents the results of a survey designed to determine the living arrangements of college students in 1971. The 1971 data are compared with data elicited by a similar survey in 1966, and some comparisons are made with 1958 data. Highlights of the survey findings include: (1) College students were fairly evenly divided in their living arrangements with about one-third living in their own households, one-third living with their parents, and one-third living in college facilities. (2) The women enrolled in college were more likely (29%) to be living in college housing than the men (20%). (3) 94% of all college students who were married and were living with their spouse lived in their own households. (4) Only 56% of the students enrolled in college in October 1971 were living with their parents during the preceding summer. (5) There was some net movement back to the county of residence of parents following college graduation. (Author/HS)

LIVING ARRANGEMENTS OF COLLEGE STUDENTS: OCTOBER 1971

The number of college students who lived in their own households increased from 1.4 million in 1966 to 2.4 million in 1971, an increase of 66 percent. However, the number of college students who lived in college housing (dormitories or fraternity or sorority houses), 1.8 million in 1971, was about the same as in 1966. These findings are based on a study of summer, fall, and post-graduation living arrangements of college students conducted by the Bureau of the Census in the October 1971 Current Population Survey.

Other highlights of the survey findings were:

1. College students were fairly evenly divided in their living arrangements. About one-third lived in their own households, one-third lived with their parents or relatives, and one-third lived away at college.

2. The women enrolled in college were more likely to be living in college housing than the men--29 percent and 20 percent, respectively.

3. Most college students who were married and living with their spouse lived in their own households, 94 percent.

4. Only a little over half, 56 percent, of the students enrolled in college in October 1971 were living with their parents or other relatives during the preceding summer.

5. There was some net movement back to the county of residence of parents following college graduation; for example, the proportion of the 1971 college graduates who were living in the same county as their parents increased from 48 percent during their last year in college to 58 percent in October 1971.

Living arrangements while attending college. College students in October 1971 were more likely to live with their parents or other relatives or in their own households than in college housing. In October 1971, there were 8.1 million students 14 to 34 years old enrolled in college. Of these college students, 2.6 million were living with their parents or other relatives, 2.4 million were living in their own households, 1.8 million were living in college housing, and 940,000 were living in other quarters, primarily rooming and boarding houses.¹ The men enrolled in college were more

¹ About 359,000 college students, or 4.4 percent, did not report on their living arrangements.

likely to be living in their own households than were the women enrolled in college--34 percent of men and 26 percent of women who reported on their living arrangements were living in their own households. Conversely, women were more likely than men to be living in college dormitories while attending college (29 percent for women as compared with 20 percent for men).

In the past 5 years, there has been a decline in the proportion of students living in college housing. In 1966, the last time before the 1971 survey that the Bureau of the Census asked a question on the living arrangements of college students in its Current Population Survey, 29 percent of all college students were living in college housing. By 1971, however, this proportion had dropped to 23 percent.² Among students enrolled in 2-year colleges--who constituted a much larger proportion of total college enrollment in 1971 than in 1966--the proportion of students living in college housing dropped from 9 percent in 1966 to 5 percent in 1971 (table B).

²Excluding the 4.4 percent who did not report on their living arrangements in 1971 and the 2.3 percent who did not report in 1966.

The decline in the proportion of college students who lived in college housing did not occur because students were more likely to remain at their parental homes and commute to the campus, but because college students were more likely to live in their own households. Both in 1966 and 1971, the proportion of all college students who lived with their parents or relatives was about at the same level--around 34 percent. However, the proportion of college students who maintained their own homes increased. The relative increase in the proportion of college students who lived in their own households was greater among those enrolled in 2-year colleges than among those enrolled in 4-year colleges. In 1966, 19 percent of the 2-year college students maintained their own home, but in 1971, 31 percent of the 2-year college students lived in their own households. A somewhat smaller proportionate increase occurred among 4-year college students. In 1966, 26 percent of all students enrolled in 4-year colleges maintained their own homes, but in 1971, 31 percent did so. Unchanged over this period, however, was the proportion of college students who lived alone or with nonrelatives, which remained at about 12 percent in both 1966 and 1971, although the proportion of 2-year college students with such living arrangements declined from 9 percent to 4 percent.

¹Includes 299,000 students who did not report on type of college.

²Excludes students who did not report on living arrangements.

Most married students lived in their own households. In October 1971, there were 2.0 million college students who were married and living with their spouse. The vast majority of the remaining 6.1 million college students were single. Of the students who were married and living with their spouse, 94 percent were living in their own households, 3 percent were living with parents or other relatives, and 1 percent were living in college housing. Of the students who were not "married, spouse present," 10 percent lived in their own households, 44 percent lived with their parents or other relatives, 31 percent lived in college housing, and 16 percent lived in rooming or boarding houses (table C).

Living arrangements during summer. Many students who were enrolled in college in the fall had not lived in their parents' households in the preceding summer. Of all the students in college in October 1971, a little over half, 56 percent, were living with their parents or other relatives in the summer of 1971.³ Many of the college students who did not live with their parents in the summer were living in their own households. In October 1971, during the school year, only about one third, 34 percent, of the college students were living with their parents or other relatives (table D). However, the majority of college students who lived at home during the summer continued to live with their parents after they entered college in the fall. Among students 14 to 34 years old in October 1971 who had lived with their parents during the summer, 56 percent were

still living at home in the fall while attending college. About a third (35 percent) had moved into college housing for the school year. Most (72 percent) of those who had lived in college housing during the summer continued to live in college housing in the fall.

¹Excludes students who did not report on living arrangements in October 1971.

²Excludes students who did not report living arrangements for summer 1971.

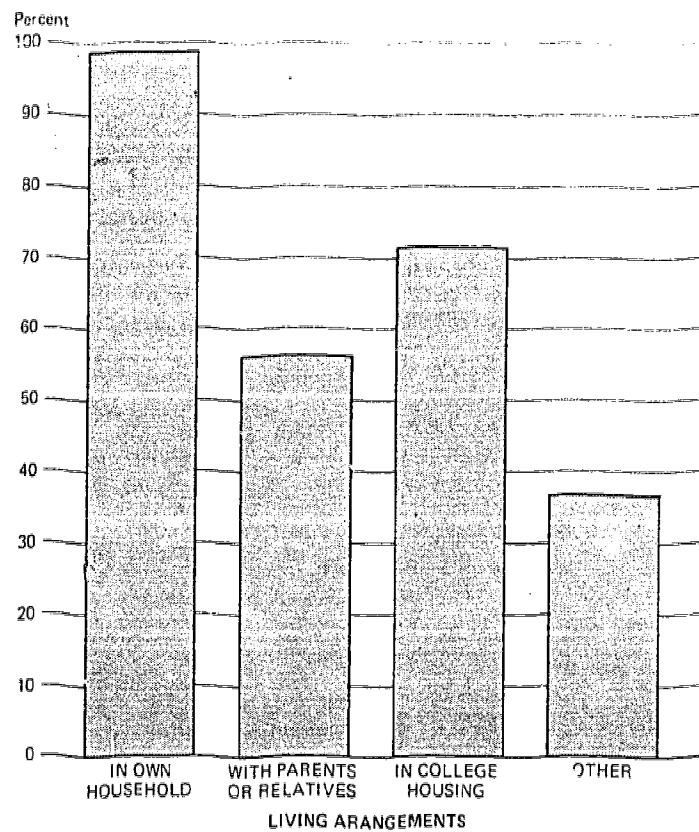

Living arrangements after graduation. Among recent college graduates not now attending school, there is a relatively small net movement back to the county of residence of the parents following college graduation. For example, among the college graduates of 1971, 48 percent were living in the same county as their parents during their final year in college, but in October 1971, 58 percent of these graduates were living in the same county as their parents.⁴ The proportion of these 1971 college graduates who lived in their parents' household increased from 16 percent during their last year in college to 26 percent in October 1971 (table E). Graduates who lived in the same county as their parents during their last year in college were likely to continue living in that county for a year or two following graduation, but most

graduates who lived in a different county from their parents did not return to live in the same county as their parents. Among the 1971 college graduates who had lived in the same county as their parents during their last year in college, 87 percent were still living in that county in October 1971. A similar proportion of students who had graduated a year earlier (1970) were still living in the county of their parents' residence in October 1971, nearly a year and a half after graduation.⁵ Among the 1971 college graduates, 52 percent lived in a different county from their parents during the year they received their degree, and only about 31 percent of these students, many of whom may have been married and living in their own households, had returned to live in the same county as their parents in October 1971 (table F).

⁴Excluding the 5.1 percent of the 1971 graduates who did not report on their living arrangements.

⁵Excluding the 4.4 percent of 1970 graduates who did not report on their living arrangements.

and October 1971: October 1971

RELATED REPORTS

Data on undergraduate college enrollment for October 1971 and 1970 by type of college, age, sex, marital status, and family income were published in Current Population Reports, Series P-20, Nos. 236 and 231. Data on school enrollment for all levels in October 1971 were published in Current Population Reports, Series P-20, Nos. 234 and 241. Data on school enrollment for all levels for October 1970 were presented in Series P-20, No. 222. Statistics on school enrollment for October in years prior to 1970 have been published in other reports in Series P-20. Statistics on college attendance and related factors, including type of college, living arrangements, marital status, field of specialization and college rank can be found in "Characteristics of Students and Their Colleges: October 1966," Current Population Reports, Series P-20, No. 183. Statistics for living arrangements in 1958 were published in, "School

Enrollment: October 1958," Current Population Reports, Series P-20, No. 93.

Statistics on school enrollment for cities, standard metropolitan statistical areas, States, regions, and the United States appear in reports of the decennial censuses. Detailed statistics on school enrollment by age and socioeconomic characteristics from the 1970 census are shown in U.S. Census of Population, Series PC(1)-C, General Social and Economic Characteristics, which consists of Part 1 for the United States and parts 2 through 52 for the 50 States and the District of Columbia.

DEFINITIONS AND EXPLANATIONS

Population coverage. The figures shown are for the civilian population excluding the relatively small number of inmates of institutions.

Figures on school enrollment from the October Current Population Survey differ from decennial census data for reasons in addition to the difference in the dates. In the first place, the survey data exclude the institutional population and members of the Armed Forces. These two groups were included in the census. Second, there were differences in field work. The small group of Current Population Survey enumerators were more experienced and had more intensive training and supervision than the large number of temporary Census enumerators and may have more often obtained more accurate answers from respondents. Third, the census was taken in a spring term (April 1970) and relates to enrollment since February 1, whereas the surveys were taken in October and relate to enrollment in the fall term (October 1966 and 1971). This difference in months of the year affects not only the extent of school enrollment (through "dropouts" during the school year, etc.) but also the level of school in which persons of a given age are enrolled.

Data from school systems. Information on college enrollment is also collected and published by Federal, State, and local governmental agencies, and by independent research organizations. This information is generally obtained

¹Excludes persons not reporting on residence.

from reports of school systems and institutions of higher learning, and from other surveys and censuses. These data are only roughly comparable with data collected by the Bureau of the Census by household interviews, however, because of differences in definitions, subject matter covered, and enumeration methods. The census data are subject to sampling variability, which may be relatively large where numbers for specific age or population groups, or for given school categories, are small.

College enrollment. The college enrollment statistics are based on replies to the enumerator's inquiry as to whether the person was enrolled in college. Enumerators were instructed to count as enrolled anyone who had been enrolled at any time during the current term or school year in any type of regular college or university. Attendance may be on either a full-time or part-time basis and during the day or night. Thus, regular college is school that may advance a person toward a college or university degree.

Two-year and four-year college. Students enrolled in the first three years of college were asked to report whether the college in which they were enrolled was a two-year college (junior or community college). Those who replied "yes" were classified as enrolled in a two-year college. Those who replied "no" were classified as enrolled in a four-year college.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro.

Marital status. The marital status category shown in this report, "married, spouse present," includes persons who are currently married and living with their spouse.

Residence of college students. In the Current Population Survey, persons living away from home while attending college who are not married and living with their spouse are counted as members of their parental households. However, the data on living arrangements of college students in this report are based on special questions asked in the October 1971 CPS and relate to the actual place where the students were staying in the summer of 1971 and at the time of the survey in October 1971 while they were attending college.

Figure 4.—Residence During Last Year in College and in October 1971, for Persons 14 to 34 Years Old Who Graduated from College During 1971

Note: Table excludes 32,000 1971 graduates and 26,000 1970 college graduates who did not report living arrangements or year of college graduation.

Residence in October 1971. Information on place of residence of persons enrolled in college was obtained from the following direct question:

While attending college, does . . . live:

Here	0
In college housing	0
With relatives	0
Someplace else	0

The enumerators were instructed to mark "here" if the person was residing in the sample unit being enumerated; to mark "in college housing" if the person lived in a dormitory, fraternity, or sorority house affiliated with the college or university; to mark "with relatives" if the person lived with relatives other than those in the sample unit; and to mark "someplace else" if the person lived in any other type of quarters, whether owned and operated by the university or by private firms or individuals. Included in this category were rooming houses, lodging houses, private homes, etc.

From replies to the question on residence in October 1971 and the question on relationship to head of household, college students were classified according to the type of place where they lived while attending school. Four categories of living arrangements were delimited: (1) In own household, which includes students who were living in a sample household and had reported they lived "here"--most being heads of households or wives of heads; (2) with parents or other relatives, which includes students who reported that they lived "here" and were a relative (but not the wife) of the head, and students who were reported as living away from home with relatives (table A separates these categories); (3) in college housing (dormitories, or fraternity or sorority houses); and (4) other, which includes students who were in a sample household but were living with non-relatives and those students away at college who were reported as living "someplace else."

Residence in summer 1971. Information on place of residence of college students in the summer of 1971 was obtained from responses to the following question:

During most of last summer, did . . . live:

Here	0
In college housing	0
With relatives	0
At college, but not in college housing	0
Someplace else	0

Enumerators were instructed to mark the first applicable category; that is, "here" if the person stayed most of the summer of 1971 in the same unit being enumerated; "in college housing" if the person lived in a dormitory, or fraternity or sorority house affiliated with the college or university; "with relatives" if the person lived at college with relatives; "at college, but not in college housing" if the person lived at school most of the summer, but not in a dormitory, or fraternity or sorority house; and to mark "someplace else" if the person lived or stayed in quarters not specified above. Included in this category were persons who travelled, persons who stayed with friends or relatives not at school, persons who lived in summer apartments not located at school, etc.

Residence at time of graduation. Information on place of residence of persons not currently enrolled in school who had graduated from college in 1970 or 1971 was obtained from responses to the following question:

4. In the first column please indicate where you lived during the last year you were working toward this degree. In the second column indicate where you live at present. (Mark one box in each column)

	Year before receiving degree	At present
SAME COUNTY AS PARENTS:		
Same household as parents	<input type="checkbox"/> 1	<input type="checkbox"/> 1
With other relatives (including spouse)	<input type="checkbox"/> 2	<input type="checkbox"/> 2
In college housing (dorms, fraternities, sororities)	<input type="checkbox"/> 3	<input type="checkbox"/> 3
Someplace else	<input type="checkbox"/> 4	<input type="checkbox"/> 4
DIFFERENT COUNTY FROM PARENTS (OR PARENTS NOT LIVING):		
With other relatives	<input type="checkbox"/> 5	<input type="checkbox"/> 5
In college housing	<input type="checkbox"/> 6	<input type="checkbox"/> 6
Someplace else	<input type="checkbox"/> 7	<input type="checkbox"/> 7

This item was included in a questionnaire on employment and training of recent college graduates which was left at the household of each respondent. The form was filled in by the respondent and returned to the Bureau of the Census.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded. With few exceptions, percentages are based on the rounded absolute numbers.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. The estimates are based on data obtained in October 1966 and October 1971 in the Current Population Survey of the Bureau of the Census. In 1971 the sample was spread over 449 areas comprising 863 counties and independent cities with coverage in each of the 50 States and the District of Columbia. Approximately 47,000 occupied housing units were eligible for interview each month. Of this number, 2,000 occupied units, on the average, were visited but interviews were not obtained because the occupants are not found at home after repeated calls or were unavailable for some other reason. In addition to the 47,000 there were also about 8,000 sample units in an average month which were visited but were found to be vacant or otherwise not to be interviewed. In 1966 the sample was spread over 357 areas comprising 701 counties in each of the 50 States and the District of Columbia; approximately 35,000 occupied housing units were eligible for interviewing. In 1958 the sample was spread over 330 areas comprising 638 counties in the 48 continental United States and the District of Columbia.

The estimating procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from the 1960 Census of Population; statistics of births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces.

Reliability of the estimates. Since the estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions, and enumerators. As in any survey work, the results are subject to errors of response and of reporting as well as being subject to sampling variability.

Since Current Population Survey interviewers are to obtain data about a student from persons at the student's usual place of residence, a student's parents must determine whether or not the student considers their home to be his or her usual residence. This may at times lead to reporting errors.

The standard error is primarily a measure of sampling variability, that is, of the variations that occur by chance because a sample rather than the whole of the population is surveyed. As calculated for this report, the standard error

also partially measures the effect of response and enumeration errors but does not measure any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better. Most are significant at a level of more than 2.0 standard errors. Thus, for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures presented in tables G, II, I, and J are approximations to the standard errors of various estimates for 1971 shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item. Tables G and II contain the standard errors of estimated numbers for a given class of persons age 14 to 34 who are enrolled in college or are recent college graduates. For 1966 data, multiply the standard errors by 1.2.

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Tables I and J show the standard errors of estimated percentages for 1971 estimates. For 1966 estimates, multiply the standard errors by 1.2.

Illustration of the use of tables of standard errors. Table 2 of this report shows there were about 6,204,000 college students, aged 14 to 34 who lived in what they considered their home in the summer of 1971. Using table I to obtain 65,213,000 as the number of persons 14 to 34, interpolation in table G shows the standard error of 6,204,000 to be approximately 109,000. The chances are 68 out of 100 that the estimate would differ from a complete census figure by less than 109,000. The chances are 95 out of 100 that the estimate would differ from a complete census figure by less than 218,000, i.e., this 95 percent confidence interval would be from 5,986,000 to 6,422,000.

Of these 6,204,000 students 4,256,000 or 68.6 percent reported that they lived at home in

750.....	-	-	-	23.0	38.0	42.0	44.0

- Represents zero.

Note: To estimate standard errors for 1966 and 1958 estimates, multiply these standard errors by 1.2.

October 1971. Interpolation in table I shows the standard error of 68.6 percent on a base of 6,204,000 to be approximately 0.9. Consequently, chances are 68 out of 100 that the 68.6 percent would be within 0.9 percentage points of a complete census figure, and chances are 95 out of 100 that the estimate would be within 1.8 percentage points of a complete census figure, i.e., this 95 percent confidence interval would be from 66.8 to 70.4 percent.

Differences. For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squares of the standard errors of each estimate

considered separately. This formula will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overstate the true standard error.

Illustration of the computation of the standard error of a difference. Table 2 also shows that 972,000 students reported they lived away from home in the summer of 1971 and lived at home in October 1971. This is about 63.7 percent of the

50.....	11.8	8.4	5.3	3.7	2.6	1.7	1.2	0.8

Note: To estimate standard errors for 1966 and 1958 estimates, multiply these standard errors by 1.2.

1,526,000 students who were reported to have lived away from home in summer. We will now compare this to the 68.6 percent we obtained for students who lived at home in summer 1971. The apparent difference of percent living at home in October 1971 is 4.9 percent. The standard error of the difference is approximated by the

formula $\sqrt{(0.9)^2 + (1.8)^2} = 2.0$. In this expression, 0.9 is the standard error on 68.6 percent, as calculated above; and 1.8 is the standard error of the 63.7 percent on a base of 1,526,000 as found by interpolation in table I. This means the chances are 68 out of 100 that the estimated

difference based on the sample would vary from the difference derived using complete census figures by less than 2.0 percent. The 68 percent confidence interval around the 4.9 percent difference is from 2.9 to 6.9, i.e., 4.9 ± 2.0 . A conclusion that the average estimate of the difference derived from all possible samples lies within this range would be correct for roughly 68 percent of all possible samples. The 95 percent confidence interval is 0.9 to 8.9 percent. Thus, we can conclude with 95 percent confidence that the proportion living at home in October 1971 is larger for students who lived at home in the previous summer.
